

# Static routing – ruting statyczny

- W ramach zajęć należy stworzyć prostą sieć składającą się z czterech maszyn wirtualnych – dwóch komputerów (PC1 i PC2) oraz dwóch ruterów (R1 i R2).
  - Adresy IP poszczególnych interfejsów urządzeń zostały już skonfigurowane, należy sprawdzić poprawność tej konfiguracji
  - Należy zbadać łączność pomiędzy urządzeniami końcowymi z użyciem polecenia **ping** i sprawdzić zawartość tablic rutingu z użyciem polecenia **route**
  - Należy uzupełnić konfigurację urządzeń w taki sposób, aby ruting statyczny działał poprawnie
  - Należy użyć programu **tcpdump** w celach diagnostycznych
- Działania te powinny umożliwić komunikację komputerów za pośrednictwem sieci

# Static routing – ruting statyczny

- **Głównym celem zajęć jest**
  - skonfigurowanie rutingu statycznego
  - analiza działania rutingu statycznego
  - lepsze zapoznanie się ze środowiskiem `netkit`

# netkit lab

## static-routing

# step 1 – network topology

## high level view

# step 1 – network topology configuration details

# Lab Scenario Personalization

- Please modify the default scenario in the following way
  - In the next slide change the name of **r1** to **r<LAB-ID>** for each configuration file, where LAB-ID is your personal ID assigned by the lab instructor
- **Note well:** from now-on
  - Command-line commands should reflect the change in naming, therefore there can be differences in the outputs shown in the manual

# step 2 – the lab

- lab directory hierarchy
  - lab.conf
  - pc1/
    - pc1.startup
  - pc2/
    - pc2.startup
  - r1/
    - r1.startup
  - r2/
    - r2.startup

## step 2 – the lab

lab.conf

```
r1[0]="A"  
r1[1]="B"  
  
r2[0]="C"  
r2[1]="B"  
  
pc1[0]="A"  
pc2[0]="C"
```

pc1.startup

```
ifconfig eth0 195.11.14.5 netmask 255.255.255.0 broadcast 195.11.14.255 up  
#route add default gw 195.11.14.1 dev eth0
```

the routing table entries  
will be added manually

pc2.startup

```
ifconfig eth0 200.1.1.7 netmask 255.255.255.0 broadcast 200.1.1.255 up  
#route add default gw 200.1.1.1 dev eth0
```

## step 2 – the lab

### r1.startup

```
ifconfig eth0 195.11.14.1 netmask 255.255.255.0 broadcast 195.11.14.255 up  
ifconfig eth1 100.0.0.9 netmask 255.255.255.252 broadcast 100.0.0.11 up  
#route add -net 200.1.1.0 netmask 255.255.255.0 gw 100.0.0.10 dev eth1
```

### r2.startup

```
ifconfig eth0 200.1.1.1 netmask 255.255.255.0 broadcast 200.1.1.255 up  
ifconfig eth1 100.0.0.10 netmask 255.255.255.252 broadcast 100.0.0.11 up  
#route add -net 195.11.14.0 netmask 255.255.255.0 gw 100.0.0.9 dev eth1
```

the routing table entries  
will be added manually

Now start the lab using the **lstart** command in the lab directory

# step 3 – testing connectivity

pc1

```
pc1:~# ping 195.11.14.1
PING 195.11.14.1 (195.11.14.1) 56(84) bytes of data.
64 bytes from 195.11.14.1: icmp_seq=1 ttl=64 time=3.17 ms
64 bytes from 195.11.14.1: icmp_seq=2 ttl=64 time=0.371 ms
64 bytes from 195.11.14.1: icmp_seq=3 ttl=64 time=0.308 ms

--- 195.11.14.1 ping statistics ---
3 packets transmitted, 3 received, 0% packet loss, time 2019ms
rtt min/avg/max/mdev = 0.308/1.285/3.176/1.337 ms
pc1:~# █
```

interfaces on  
the same  
domain can  
reach each  
other

# step 3 – testing connectivity

```
pc1
pc1:~# ping 100.0.0.9
connect: Network is unreachable
pc1:~#
```

interfaces on different domains cannot be reached

can you tell why?

# step 3 – inspecting routing tables

- both routers and pcs don't know how to reach networks that are not directly connected to them

▼ pc1

```
pc1:~# route
Kernel IP routing table
Destination      Gateway          Genmask          Flags Metric Ref    Use Iface
195.11.14.0      *                255.255.255.0    U        0      0      0 eth0
pc1:~# █
```

▼ r1

```
r1:~# route
Kernel IP routing table
Destination      Gateway          Genmask          Flags Metric Ref    Use Iface
100.0.0.8        *                255.255.255.252  U        0      0      0 eth1
195.11.14.0      *                255.255.255.0    U        0      0      0 eth0
r1:~# █
```

- **directly connected** networks are **automatically** inserted into the routing table when the corresponding interface is brought up
- this is a common behavior of all ip devices (even real-world routers!)

# step 4 – default routes on pcs

- to fix the problem we could specify the default route on the pcs: “through this gateway (ip number) you can reach all the other networks”

▼ pc1

```
pc1:~# route add default gw 195.11.14.1
```

```
pc1:~# route
```

```
Kernel IP routing table
```

Destination	Gateway	Genmask	Flags	Metric	Ref	Use	Iface
195.11.14.0	*	255.255.255.0	U	0	0	0	eth0
default	195.11.14.1	0.0.0.0	UG	0	0	0	eth0

```
pc1:~# █
```

▼ pc2

```
pc2:~# route add default gw 200.1.1.1
```

```
pc2:~# route
```

```
Kernel IP routing table
```

Destination	Gateway	Genmask	Flags	Metric	Ref	Use	Iface
200.1.1.0	*	255.255.255.0	U	0	0	0	eth0
default	200.1.1.1	0.0.0.0	UG	0	0	0	eth0

```
pc2:~# █
```

# step 4 – default routes on pcs: test

```
pc1
pc1:~# ping 100.0.0.9
PING 100.0.0.9 (100.0.0.9) 56(84) bytes of data.
64 bytes from 100.0.0.9: icmp_seq=1 ttl=64 time=0.451 ms
64 bytes from 100.0.0.9: icmp_seq=2 ttl=64 time=0.299 ms
64 bytes from 100.0.0.9: icmp_seq=3 ttl=64 time=0.320 ms

--- 100.0.0.9 ping statistics ---
3 packets transmitted, 3 received, 0% packet loss, time 2003ms
rtt min/avg/max/mdev = 0.299/0.356/0.451/0.070 ms
pc1:~#
```

the  
"backbone  
interface" of  
r1 is  
reachable

# step 4 – default routes on pcs: test

pc1

```
pc1:~# ping 100.0.0.10
PING 100.0.0.10 (100.0.0.10) 56(84) bytes of data.

--- 100.0.0.10 ping statistics ---
7 packets transmitted, 0 received, 100% packet loss, time 6105ms

pc1:~# █
```

interfaces on  
r2 seem  
unreachable!

can you tell  
why?

## step 4 – let's inspect the network

- do echo request packets reach `r2`?
- let's check...
  - while pinging from `pc1` 100.0.0.10 sniff on interface `eth1` of `r2`

```
r2:~# tcpdump -i eth1
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on eth1, link-type EN10MB (Ethernet), capture size 96 bytes
16:06:58.977851 arp who-has 100.0.0.10 tell 100.0.0.9
16:06:59.088906 arp reply 100.0.0.10 is-at fe:fd:64:00:00:0a
16:06:59.089990 IP 195.11.14.5 > 100.0.0.10: icmp 64: echo request seq 1
16:06:59.989368 IP 195.11.14.5 > 100.0.0.10: icmp 64: echo request seq 2
16:07:01.001888 IP 195.11.14.5 > 100.0.0.10: icmp 64: echo request seq 3

5 packets captured
5 packets received by filter
0 packets dropped by kernel
r2:~#
```

echo requests are  
arriving!

## step 4 – r2's routing table

```
r2:~# route
Kernel IP routing table
Destination      Gateway          Genmask          Flags Metric Ref    Use
Iface
100.0.0.8        *               255.255.255.252  U        0      0      0 eth1
200.1.1.0        *               255.255.255.0   U        0      0      0 eth0
r2:~# █
```

- pc1's address is 195.11.14.5
- r2 does not know how to reach such an address.
- echo requests arrive to r2 but r2 does not know where echo replies should be forwarded!
- somebody should teach r2 how to reach pc1
- we may insert a **static route** into the routing table of r2

# step 5 – configuring a static route

```
r2:~# route add -net 195.11.14.0 netmask 255.255.255.0 gw 100.0.0.9 dev eth1
```

network 195.11.14.0...

...with netmask 255.255.255.0...

...is reachable via 100.0.0.9...

...on interface eth1

```
r2:~# route
Kernel IP routing table
Destination      Gateway          Genmask          Flags Metric Ref    Use Iface
100.0.0.8        *                255.255.255.252  U        0      0        0 eth1
200.1.1.0        *                255.255.255.0   U        0      0        0 eth0
195.11.14.0      100.0.0.9        255.255.255.0   UG       0      0        0 eth1
r2:~#
```

# step 5 – configuring a static route

- a similar configuration should be deployed on **r1**

```
r1:~# route add -net 200.1.1.0 netmask 255.255.255.0 gw 100.0.0.10 dev eth1
r1:~# route
Kernel IP routing table
Destination        Gateway            Genmask           Flags Metric Ref    Use Iface
200.1.1.0          100.0.0.10        255.255.255.0     UG    0      0      0 eth1
195.11.14.0        *                  255.255.255.0     U      0      0      0 eth0
r1:~#
```

# step 5 – testing static routes

- the pcs can reach each other

```
pc1:~# ping 200.1.1.7
PING 200.1.1.7 (200.1.1.7) 56(84) bytes of data.
64 bytes from 200.1.1.7: icmp_seq=1 ttl=62 time=111 ms
64 bytes from 200.1.1.7: icmp_seq=2 ttl=62 time=1.05 ms
64 bytes from 200.1.1.7: icmp_seq=3 ttl=62 time=0.820 ms

--- 200.1.1.7 ping statistics ---
3 packets transmitted, 3 received, 0% packet loss, time 2042ms
rtt min/avg/max/mdev = 0.820/37.779/111.467/52.105 ms
pc1:~#
```

```
pc2:~# ping 195.11.14.5
PING 195.11.14.5 (195.11.14.5) 56(84) bytes of data.
64 bytes from 195.11.14.5: icmp_seq=1 ttl=62 time=0.954 ms
64 bytes from 195.11.14.5: icmp_seq=2 ttl=62 time=0.947 ms
64 bytes from 195.11.14.5: icmp_seq=3 ttl=62 time=1.27 ms

--- 195.11.14.5 ping statistics ---
3 packets transmitted, 3 received, 0% packet loss, time 2049ms
rtt min/avg/max/mdev = 0.947/1.057/1.271/0.153 ms
pc2:~#
```

# Reporting

- Please deliver the following items to the UPEL system using your account
  1. A photocopy or a screenshot showing the output of the following commands:
    - **route** executed on router r<LAB-ID>
    - **ping 200.1.1.7** executed on pc1
    - **ping 195.11.14.5** executed on pc2

# obligatory exercises

- the default route can be statically configured by using

```
route add default gw 195.11.14.1 dev eth0
```

- can you give a command to configure a **static route** that is equivalent to the **default route**?

```
route add -net ____ netmask ____ gw ____ dev ____
```

# obligatory exercises

- not all the routing tables contain a default route
- the network of this lab is so simple that routers `r1` and `r2` can be also configured to **exclusively** use **default routes** (i.e., static routes should be removed)
- try such a configuration and test it
